It is compatible with most hosts and host/device combinations, and allows you to create VST, AU and Audio Units.Electrical devices are commonly housed in enclosures that protect the device from damage and provide a controlled environment for the operation of the device. Enclosures are constructed in a variety of shapes and sizes to fit the particular device being housed. Enclosures usually include one or more openings to allow the passage of electrical signals between the device and the external environment. The openings are commonly covered by panel members that allow the passage of electrical signals while preventing the passage of foreign materials such as rain, dirt, and insects. Enclosures for electrical devices can be referred to as cabinets, housings, cases, or enclosures. Enclosures may be constructed of one or more materials. For example, enclosures may be constructed of metal, plastic, wood, or a combination of materials. Enclosures may include internal or external casters. An internal caster is mounted within the enclosure and typically includes a wheel that protrudes from an opening in the enclosure. The wheel may be mounted to the frame of the enclosure or may be suspended from a panel member that covers the opening of the enclosure. An external caster is mounted to the enclosure outside of the opening in the enclosure and is generally utilized on larger enclosures or enclosures that will be moved or transported. An external caster is often used when the device is installed in an outdoor environment. Typically, when installing an enclosure in an outdoor environment, the installer must first mark the desired placement of the enclosure. This may include marking the location of the enclosure on a wall or stake, or on the ground. Once the desired location of the enclosure is marked, the installer positions the enclosure at the desired location and then inserts one or more fasteners through the enclosure and into the ground or wall. The fasteners

are used to secure the enclosure to the desired location. When securing the enclosure to a wall or stake, the installer must utilize two or more fasteners to prevent the enclosure from falling off the wall or stake. If the installer only utilizes one fastener, the enclosure may tip on the fastener and fall to the ground f988f36e3a
