Today, Apple announced the new iPad Pro, a stunning display with a new Apple Pencil. When you're working on photos and videos, sending, receiving, and reading email or browsing the web, you'll find incredible new tools to help you learn, create, and share without leaving the app. Adobe's Photoshop (CS5) does a lot of things right. For starters, it does a perfect job of handling photos created from, or exported to, cameras that are being controlled by Lightroom, and vice versa. Naturally, though, comes the question: What about the other end of the equation—photos created with Lightroom that need to be edited in Photoshop? That's not an insurmountable problem. Anyone who has tried Lightroom and Photoshop knows that it's a natural pairing for these two different approaches to photo editing. But Adobe now has a version of Photoshop that works seamlessly with Lightroom—a gift, in my book, to the organization man, in the sense that the whole family could paint with Lightroom and Photoshop. If Photoshop is a stick, then Lightroom and Photoshop are the carrot; work together or not, and they'll be great for you. I use Photoshop for more image editing, and Lightroom for all other facets of a digital workflow, from basic image organizing and editing to batch processing. By using both tools at the same time, you're much more likely to end up with something that achieves your goal. If, as complicated as this may sound, you like to edit and create images with tools other than Lightroom and Photoshop, you can still have this digital photo production power-house running right alongside your organization software—and almost everything else—right on your computer.
